

Press Release

What's new at MONOSEM ?

During the autumn shows in 2008, MONOSEM will be exhibiting the new NG Plus 4 planter on their stand.

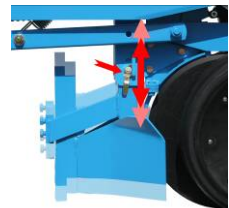

New NG Plus 4 precision planter.

MONOSEM improves the planter operating comfort by launching the new NG Plus 4 planter. This precision planter has the same double discs and rests on the ground directly in line with the seed drop for optimal planting. The main improvements include:

- **New clod remover bracket :**

The metering unit now has an adjustable clod remover bracket with a single locking pin thus combining ease of adjustment and precision. And in order to adapt the accessories to the planting conditions, the clod removers are interchangeable with the trash wheels.

- **Open rear press wheel unit :**

The NG Plus 4 is also equipped with a new open rear press wheel unit enabling a better clearance in sticky conditions. This rear press wheel unit also offers increased adjustment possibilities, notably the off-setting of the press wheels, thus improving the furrow closing in all conditions (stones, trash, hard soils...).

- **New depth control indicator :**

The adjustment of the planting depth is still made by a simple lever. But the new depth control indicator is now visible from the rear of the machine. This indicator has the advantage of resisting washing and is weatherproof.

- **Optional mechanical row cut-off with lever :**

The new mechanical row cut-off system with lever, available on option, is an economical solution for declutching a metering unit. For even more comfort, an electromagnetic declutching system controlled for the tractor cab is also available.

The NG Plus 4 is a multi-purpose planter capable of working in not only well prepared soils but also in low-till conditions. The improvements on the NG Plus 4 enable a greater operating comfort. The wide choice of accessories (fertilizer, seed monitor, Microsem,...) meets with the various requirements of the operators.
